ABOUT *OUR PROFILE*

Online shopping is a form of electronic commerce which allows consumers to directly buy goods or services from a seller over the Internet using a web browser or a mobile app. An online store is a website, app or platform that helps businesses sell their products or services digitally. Online stores offer convenience, accessibility, and often a wider range of products than bricks-and-mortar stores, allowing customers to browse, place orders, and make payments virtually.

Mission

Shopping missions represent specific shopping goals or tasks that consumers and shoppers embark upon in their quest to fulfil their needs or desires. These missions mirror real-world scenarios and provide a comprehensive look into consumer preferences, behaviours, and motivations.

Vision

I had ordered many things from Shopy Vision from price of 200-25000. They won't disappoint me. And delivery time is best from other Courier service. They always sell Good and Genuine products.

What is Crypto Trading

Cryptocurrency trading is the act of speculating on cryptocurrency price movements via a CFD trading account, or buying and selling the underlying coins via an exchange. At its heart, cryptocurrency trading involves buying and selling cryptocurrencies, just like any other trading you might know of, such as stocks, commodities and forex. Traders aim to make money by guessing the price movements of volatile digital assets. To start trading cryptocurrencies, you first need to open a trading account with a reputable broker or exchange. Once your account is set up and funded, you can start trading. It's recommended to start with a demo account to practice trading without risking real money. How do you predict cryptocurrency prices?

Cryptocurrency, or crypto, is a digital currency that operates on a computer network without the need for a central authority like a bank or government. Cryptocurrencies are stored in a digital ledger, which is a computerized database that uses cryptography to secure transactions and control the creation of new coins. Cryptocurrencies use public-private key cryptography to transfer coin ownership. The owner of the wallet has a private key, which is a secure password that they never share with anyone.
